1 Introduction

National Multiple Sclerosis Patient Registry (ReMuS) was mainly created to obtain data on the occurrence, incidence and clinical course of multiple sclerosis (MS), its clinical symptoms, MS relapse frequency rates, disease progression, MS treatment, disability development, comorbidities and causes of death. The objective is to provide outputs for cost and effectiveness monitoring of health care and medicinal preparations, evaluation of information to be provided to health care payers, other public institutions and medicinal preparation manufacturers, further to assess the severity of MS and its socioeconomic impacts, and to facilitate the creation of outputs for scientific and statistical purposes.

Based on acquired data, it will be possible to look for possible risk factors both for the occurrence of MS itself and lack of effectiveness of treatment or more rapid progression of the disease. Information on course of MS will enable health care payers to better plan the financial means necessary for the treatment of this disease. Information on treatment effectiveness is instrumental in improving therapeutic choices and implement changes or modifications when relevant.

The registry now includes, in this first phase, only multiple sclerosis patients who:

- undergo treatment in one of the participating MS treatment centres
- have received one of the DMDs (disease modifying drugs) preparations (i.e. disease progression modifying treatment) or IVIGs (intravenous immunoglobulins) any time after 1. 1. 2013,
- have signed informed consent with processing their personal and clinical data in ReMuS registry.

Detailed analysis included only patients who had the record in the registry from the first half of the year 2015.

Remus MULTIPLE SCLEROSIS PATIENT REGISTRY

2 Results

As of 30. 6. 2015, ReMuS registry included data of patients from thirteen MS treatment centres – General University Hospital in Prague (VFN), Teplice, Jihlava, University Hospital Motol in Prague, University Hospitals in Plzeň, Pardubice, University Hospital in Ostrava, University Hospital Královské Vinohrady, Thomayer University Hospital in Krč, University Hospital in Hradec Králové, University Hospital in Brno (Bohunice), University Hospital in Olomouc, and hospital in České Budějovice. The analysis included, according to previous agreement, data of patients who were treated in the period from 1. 1. 2013 with one of the DMD and IVIG preparations reported below and also had available actual data:

- DMDs Avonex, Betaferon, Copaxone, Extavia, Gilenya, Rebif[22], Rebif[44], Tysabri, Aubagio, Tecfidera
- IVIGs Endobulin, Flebogamma, Gammagard, Kiovig, Octagam.

Table 1 included the final number of patients included in ReMuS registry as of 30. 6. 2015. In the first column it is shown the total number of patients in the registry (patients fulfil the condition of informed consent and DMD or IVIG treatment). In the second column it is shown the number of patients with actual data (last visit from the first half of the year 2015) included in the current half-year analysis.

Table 1 Total number of patients by centres

Centre	Patients in the registry	Analysed patients	Percentage in the analysis
VFN	1969	1943	27,4%
Teplice	704	671	9,5%
Jihlava	218	213	3,0%
Motol	801	777	10,9%
Plzeň	432	424	6,0%
Pardubice	400	397	5,6%
Ostrava	655	624	8,8%
Vinohrady	254	253	3,6%
Krč	263	258	3,6%
Hradec Králové	686	678	9,6%
Brno Bohunice	342	341	4,8%
Olomouc	174	173	2,4%
Č. Budějovice	353	347	4,9%
Total	7251	7099	100,0%

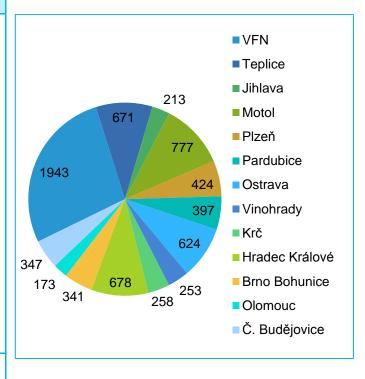

Figure 1 Total number of analysed patients by centres

The table and figure below illustrate the development of the number of patients and centres participating in ReMuS registry from the creation of the registry till present. The first data export in summer 2013 analysed data originating from three centres - a total of 1 501 patients. Two years later, in summer 2015, the registry has expanded to include 13 MS treatment centres already, so the data of 7 099 patients from the whole of the Czech Republic enter analysis.

Table 2 Number of patients in the ReMuS registry - development

Data export date	Number of centres	Number of patients to be analysed
30.6.2013	3	1501
31.12.2013	7	2920
30.6.2014	12	4715
31.12.2014	12	5639
30.6.2015	13	7099

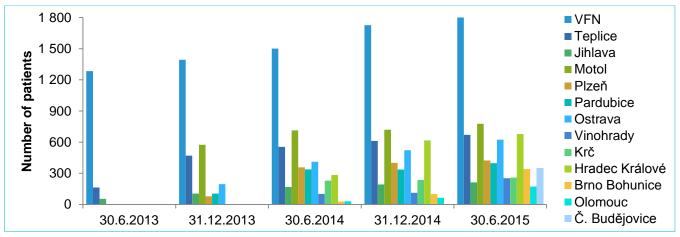

Figure 2 Number of patients in the registry contributed by individual centres - development

2.1 Demographic data

2.1.1 Sex

Taken together, all centres treat 71,6 % women and 28,4 % men.

Table 3 Patient distribution by sex

Carr	All centres			
Sex	Number	Percentage		
Females	5085	71,6%		
Males	2014	28,4%		

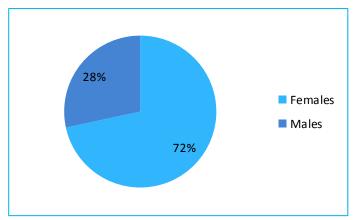

Figure 3 Patient distribution by sex

2.1.2 Age at last patient visit

Mean age at last visit is 40,4 years. For females, mean age was slightly higher than in men. Overall, the registry now includes 33 patients younger than 18 years, and 8 of these are younger than 15 years. When all MS treatment centres are taken together the most represented age group is that of patients aged 30 – 40 years.

Table 4 Patient age in years at last visit

Centre	Mean	Median	Minimum	Maximum	SD	Number of missing values
All centres	40,4	39,8	8,8	77,7	10,2	0

Table 5 Patient age in years at last visit by sex

Centre	Sex	Mean	Median	Minimum	Maximum	SD	Number of missing values

80 – 90	0	0,0%	
90 – 100	0	0,0%	

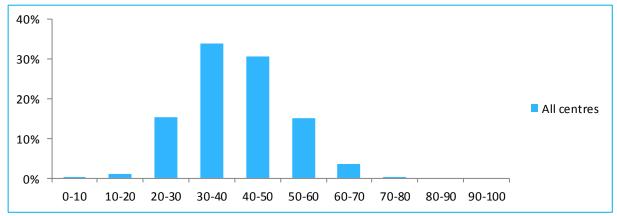

Figure 4 Patient distribution by age

2.1.3 Age at disease onset

Date of disease onset is an important parameter that is used to calculate patient age at disease onset and disease duration period. This parameter was missing for 38 patients.

Mean age at disease onset is 30,3 years. Table 8 shows, however, that patient age at disease onset ranged from below 4 years to almost 70 years.

Table 8 Patient age in years at the time of disease onset

Centre	Mean	Median	Minimum	Maximum	SD	Number of missing values
All centres	30,3	29,1	3,5	67,3	9,4	38

2.1.4 Patient distribution by individual healthcare insurance companies

Table 9 and Figure 5 show the distribution of patients in the registry by individual health insurance companies. 58,3 % patients are insured with the General Health Insurance Company (code: 111). 13,3 % are insured with Health Insurance Company of the Ministry of Internal Affairs (code: 211) and 10,0 % with Business Health Insurance Company (code: 207).

Table 9 Patient distribution by health insurance companies

Health Insurance Co.	All centres		
Health insurance Co.	Number	Percentage*	
111	4140	58,3%

211	946	13,3%	
213	173	2,4%	
Other	4	0,1%	

^{* 1} patient had no data entered for health insurance company

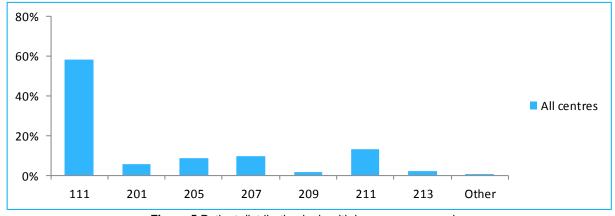

Figure 5 Patient distribution by health insurance companies

2.1.5 Patient distribution by regions

The registry makes it possible to obtain data on patient distribution by individual Czech Republic regions based on ZIP codes attached to patient residence addresses. ZIP codes assigned to communities that were part of two regions were assigned to the region that included most of the included communities. ZIP codes not found in the ZIP code registry of the Czech National Postal Office (Czech Post) were interpreted as incorrect.

The registry includes patients from all Czech Republic regions. Low patient numbers from South Moravia, Olomouc and Zlín regions are due to slow participation initiation of MS treatment centre in Olomouc and not involvement of the centres from Zlín and Brno Sv. Anna. Patient data are gradually completed in the registry.

Table 10 Patient distribution by regions of their residence

Dogiono	All centres		
Regions	Number	Percentage*	
South Bohemia	499	7,0%	
South Moravia	310	4,4%	
Karlovy Vary	195	2,7%

Zlín	121	1,7%	

^{* 1} patient did not have completed residence addresses and 1 patient had the place of permanent residence in Slovakia

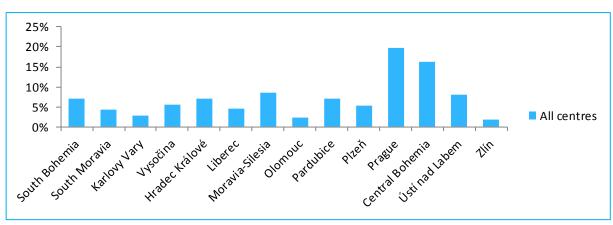

Figure 6 Patient distribution regions of their place of residence

2.2 Employment and social benefits

Employment and provision of social benefits are evaluated based on data obtained at last visit. These parameters must be completed at each visit even when the condition remains the same.

It should be noted that all possibilities and combinations of employment and especially those for social benefits cannot be appreciated and the clarity and purposefulness of the output is preserved at the same time. It was thus necessary to introduce certain preference criteria so the physicians be able to complete the data and decide what options to choose in unclear combined cases. These preference criteria (that is that the type of disability pension [DP] takes precedence over unemployment benefits or maternal leave [ML]) must be taken into account when interpreting and presenting this type of data.

2.2.1 Employment

As part of entering employment data, selection must be made among the options PTE – part-time employment, FTE – full-time employment, DNW – does not work (irrespective of the reasons for employment/unemployment and possible social benefits) and STUDENT – studies (social and health insurance is paid for by the state).

Almost one half of the patients have full-time employment (54,8 %), followed by 13,0 % patients who work part-time.

Table 11 Patient distribution by employment

Employment	All centres				
Employment	Number	Percentage*			
PTE	923	13,0%			
FTE	3893	54,8%			
DNW	1718	24,2%			
STUDENT	209	2,9%			

^{* 5.0 %} patients did not have data on employment completed

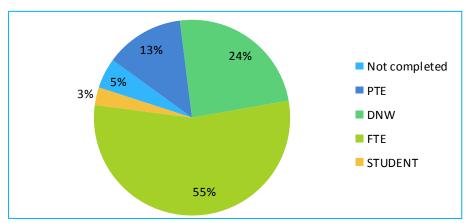

Figure 7 Patient distribution by employment type

2.2.2 Social benefits

The structure of social benefits is based on simplified data as the completer had always to choose one, "most important" benefit in cases where a patient was receiving more benefits. DP1, DP2 and DP3 are social benefits that were of most interest to us - these codes denote 3 degrees of disability pension. ML - maternity leave is only reported as secondary information, as are unemployment benefits (UNEMPL). OAP codes for old-age pension.

53,8 % patients do not receive any social benefit.

Table 12 Patient distribution by type of social benefit

Canial hamafit	All centres		
Social benefit	Number	Percentage*	
DP1	975	13,7%	
DP2	548	7,7%	
DP3	821	11,6%	
ML	374	5,3%	
UNEMPL	80	1,1%	
OAP	127	1,8%	
Does not receive (X)	3818	53,8%	

^{* 5,0 %} patients had no data completed for social benefits

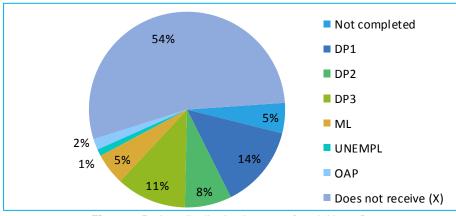

Figure 8 Patient distribution by type of social benefit

Disease duration period

Mean disease duration period is 10,1 years.

Table 13 Disease duration period (from disease onset to last visit)

Centre	Mean	Median	Minimum	Maximum	SD	Number of missing values
All centres	10,1	8,5	0,1	44,9	7,5	38

2.4 Degree of damage

Degree of damage is assessed using assigned EDSS (Expanded Disability Status Scale) value at each visit. Degree of damage is analysed as that found at the last available patient visit.

EDSS ranges from 0 to 10, where 0 means healthy patient without complaints, degree 5 corresponds to considerable damage, inability to work and ability to walk for a distance less than 500 metres, and degree 10 means death due to MS.

Median EDSS value is 2,5. Most patients are in the EDSS group between 1,5-2.

Table 14 Degree of damage (EDSS value) at last visit

Centre	Mean	Median	Minimum	Maximum	SD	Number of missing values
All centres	2,7	2,5	0,0	8,0	1,5	26

Table 15 Degree of damage (EDSS value) at last visit

EDSS	All centres		
ED33	Number	Percentage*	
0 – 1	990	13,9%	
1,5 – 2	2564	36,1%	
2,5 – 3	1255	17,7%	
3,5 – 4	1067	15,0%	
4,5 – 5	674	9,5%	
5,5 – 6	385	5,4%	
6,5 – 7	128	1,8%	
7,5 – 8	10	0,1%	
8,5 – 9	0	0,0%	
9,5 – 10	0	0,0%	

^{* 0,4 %} patients had no data completed about EDSS degree

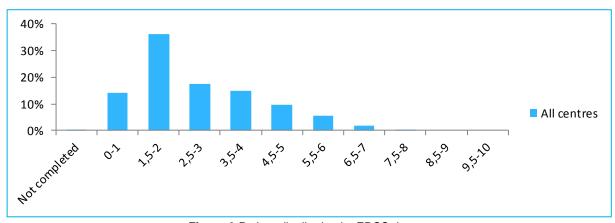

Figure 9 Patient distribution by EDSS degree

2.5 Relapse

Over the last 6 months, relapse of the disease (recurrence of symptoms) was recorded in 13,0 % patients, while this rate was 28,1 % over the period of 12 months. What should be taken into account is that the number of relapses reported here is an overall number including multiple relapses in one patient. Mean number of relapses annually (ARR, annualized relapse rate) is 0,281.

Table 16 Relapse occurrence over last 6 and 12 months

Dalana	All centres		
Relapse	Number	Percentage	
Over 6 months	922	13,0%	
Over 12 months	1998	28,1%	

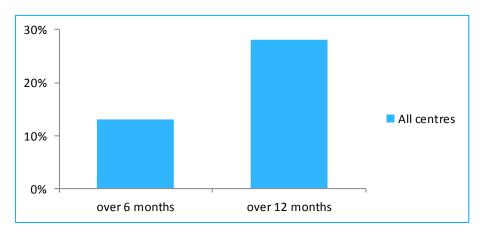

Figure 10 Proportion of relapses over last 6 and 12 months

Relapse severity is defined as mild, moderate or severe. Mild relapse intensity means that the relapse does not impact negatively on activities of daily life (ADLs). Moderate intensity does impact on activities of daily life already, while the severe form is recorded in cases where the relapse is associated with severe discomfort of the patients, deteriorates their activities of daily life significantly and results in their inability to work, or hospital admission.

Severity of most relapses was mild or moderate. Mild relapses accounted for 52,1 % and moderately severe relapses for 42,7 % of all recorded relapses over the last 6 months.

Table 17 Relapse severity over last 6 and 12 months

Relapse	All centres		
over 6 months	Number	Percentage*	
Mild	480	52,1%	
Moderate	394	42,7%	
Severe	36	3,9%	
Relapse			
over 12 months	Number	Percentage*	
Mild	997	49,9%	
Moderate	900	45,0%	
Severe	83	4,2%	

^{*} In 1,3 % of the recorded relapses data on relapse severity over last 6 months were missing In 0,9 % of the recorded relapses data on relapse severity over last 12 months were missing

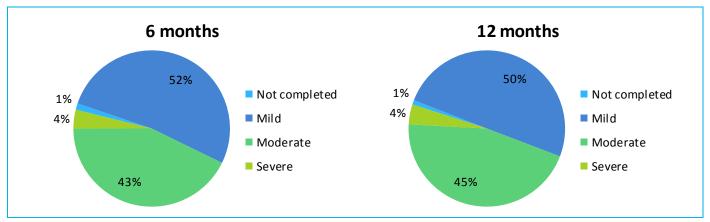

Figure 11 Relapse severity over last 6 and 12 months

The last analysed parameter was the form of relapse treatment – outpatient vs. inpatient treatment. Vast majority of the relapses was treated on outpatient basis. The number of hospitalizations is around10 percent.

Table 18 Type/form of relapse treatment over last 6 and 12 months

Relapse	All centres		
over 6 months	Number	Percentage*	
Outpatient	842	91,3%	
Hospital stay	60	6,5%	
Relapse	All centres		
over 12 months	Number	Percentage*	
Outpatient	1795	89,8%	
Hospital stay	159	8,0%	

^{* 2,2 %} of relapses recorded over the last 6 months data on type of treatment were missing

^{2,2 %} of relapses recorded over the last 12 months data on type of treatment were missing

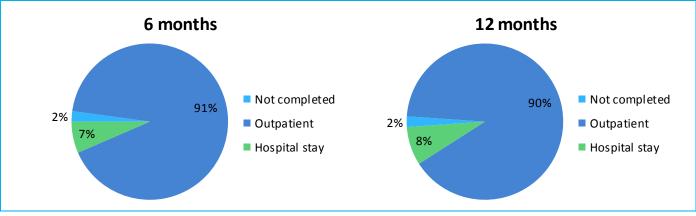

Figure 12 Type/form of treatment over last 6 and 12 months

2.6 Treatment

Evaluation of MS treatment included the preparation used at last visit, a DMD or IVIG. 13 patients did not terminate their treatment for 2 preparations, so the numbers for these patients are included twice. In some cases, it is a parallel treatment with two medicines. It is, however, mostly due to erroneous input into the system (these duplicities will be removed from the registry in the future).

Patients receiving IVIG preparations were included by very few centres in this phase. Some centres still have not specified the concrete type of IVIG. 271 patients (3,8 %) did not receive any DMD or IVIG preparation at their last visit (their treatment was temporarily or permanently discontinued). These 271 patients are not included in Table 19, but are included in Table 20.

Most patients received Copaxone (22,2 %) or Avonex (19,4 %).

Table 19 Patient distribution by the preparation used at last visit

Toologo	All centres	
Treatment	Number	Percentage
DMD		
Avonex	1325	19,4%
Betaferon	606	8,9%
Copaxone	1517	22,2%

Aubagio	137	2,0%
Tecfidera	143	2,1%
IVIG	2	0,0%
Endobulin	0	0,0%
Flebogamma	109	1,6%
Gammagard	6	0,1%
Kiovig	44	0,6%
Octagam	4	0,1%

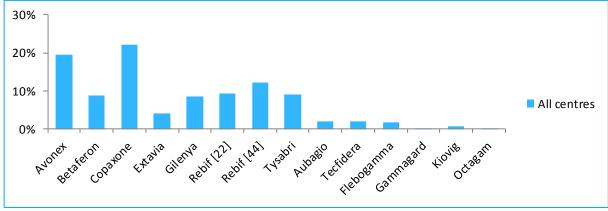

Figure 13 Medicinal preparations used - DMDs and IVIGs

New initiations, terminations or change of therapy with DMDs/ IVIGs 2.6.1

As part of a more detailed analysis of patient treatment the proportion of patients was determined who initiated treatment with new DMD/ IVIG preparations over the last half year prior to data export on 30.6. 2015. 3,5 % patients initiated treatment with these preparations.

The number of patients who terminated treatment with DMDs over the period of interest cannot be exactly determined at present. At their last visit, 271 patients (3,8 %) received no treatment. 101 of these patients terminated/discontinued treatment over the half year of interest, and the remaining 170 patients had terminated treatment earlier and did not initiate new treatment over the period of interest.

The last recorded parameter was the number of patients who changed their DMD or IVIG preparation over the period of interest. The proportion of these patients was 5,9 % overall.

Table 20 Number of patients who initiated new treatment with DMDs/ IVIGs, terminated or changed these preparations over the period of interest

Farrage of minerals			
Treatment	All centres		
пеашет	Number	Percentage	
Initiation	245	3,5%	
New termination	101	1,4%	
Earlier termination	170	2,4%	
Termination overall	271	3,8%	
Change	421	5,9%	

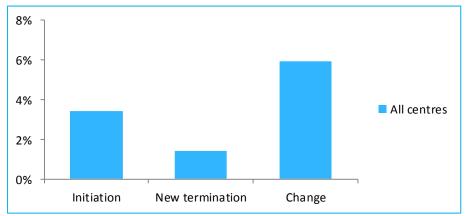

Figure 14 New initiation, termination or change of therapy with DMDs

Health-related events 2.7

2.7.1 Pregnancy

Over the evaluated period from 1. 1. 2015 to 30. 6. 2015 a total of 41 MS patients (0,8 %) delivered children. 38 of these gave birth to 1 child, 3 patients gave birth to twins.

Table 21 Number of delivered children born over the period of interest

Dramanaiaa	All centres	
Pregnancies	Number	Percentage
Number of deliveries	41	0,8%

2.7.2 Adverse events

The number of predefined adverse events was equal to 0,6 %. Some centres had not yet started to complete this parameter in more detail. These results cannot thus be reliably interpreted so far. There is no correction in place for data expression in percentages for the case of multiple AEs in one patient.

In the last 6 months, there was reported only one severe health-related event which was not, according to the attending physician, related to the treatment of MS.

Table 22 Number of adverse events with first occurrence in the period of interest

Nivers have of a division a system	All centres		
Number of adverse events	Number	Percentage	
Number of AEs	97	1,4%	
Number of predefined AEs	41	0,6%	
Number of severe AEs	1	0,0%	

3 Conclusion

On 30. 06. 2015, the fifth data export into ReMuS registry was delivered, followed by interim data analysis from the registry focusing on the period from 1. 1. 2015 to 30. 06. 2015. Over the evaluated period data from thirteen MS treatment centres included in ReMuS registry were available - General University Hospital in Prague (VFN), from Teplice, Jihlava, University Hospital in Motol, Prague, Pardubice, University Hospital in Olomouc, University Hospital Královské Vinohrady, Thomayer Hospital in Krč, University Hospital Hradec Králové, University Hospital in Brno (Bohunice), University Hospital in Olomouc, and hospital in České Budějovice. These centres enter data on their patients in the registry on continual basis, and as of the day of data export on 30. 06. 2015 data on treatment of 7 251 patients was available. After elimination of patients without actual data, data of 7 099 patients from the whole Czech Republic entered into the analysis.

Of patients included in the registry, 71,6 % are women, mean patient age at last visit is 40,4 years and mean age at disease onset is 30,3 years. 99,5 % patients were older than 18 years at last visit. 58,3 % patients are insured with the General Health Insurance Company. The registry already includes data of patients from all regions of the Czech Republic. There was marked improvement of data quality and percentages of completed data for employment and social benefits. 67,8 % patients are able to work (they work full-time or part-time) and 33,0 % receive degree 1-3 disability pensions. The most represented group in terms of degree of damage are patients with EDSS between 1,5 and 2. Mean number of relapses in one year (ARR, annualized relapse rate) is 0,281. More than a half of (52,1 %) relapses over the last 6 months were of mild severity, and the vast majority of patients were treated as outpatients. Medicinal preparations used most commonly are Copaxone (22,2 %) and Avonex (19,4 %). In the study period, 3,5 % of patients started with DMD treatment, 1,4 % patients ended or interrupted the DMD treatment and 5,9 % of patients changed DMD treatment. 44 children were born to the patients with MS during the last 6 month. No severe adverse event related to MS treatment occurred over the evaluated period.

Data interpretation should consider that individual MS treatment centres started their participation gradually and added new patients slowly. All participating centres complete and correct data based on error reports.

Compared to the first data export in June 2013, the number of patients in the registry increased five-fold while the number of both erroneous and missing data was reduced. Last but not least, participation of new centres increased variability of patients and their treatment in the Czech Republic.
